

KAYAN

The Talent Operating System

How a person becomes verified Kayan talent, how they are placed into a team, how they are paid, how they give back, and how they carry a credential the market can check.

This document sets out the whole system in prose. The workbook **KAY-TOS-001** carries the same system as sixty operable tabs — the field specification, the procedures, the registers, the live dashboard and the build plan. The developer pack carries the schema, the API surface and the state machines. The three are one instrument and are read together.

A NOTE ON THE MARKED VALUES

Tokens shown like **PH-SCORE-T1** are deliberate gaps, not omissions. Every one is listed in the placeholder register with what it governs and who resolves it. The structure of this system does not depend on any of them.

01 The problem this system solves

Yemen has no shortage of capable people. It has a shortage of ways to prove that they are capable, and a shortage of anyone willing to stand behind them when they are. That is the gap this system closes.

A designer in Aden and a designer in Amman may be equally good. The difference is that one of them can be checked. A client in Riyadh or an organisation in Geneva can look up the second one, see a history, call a referee, and know who to pursue if the work fails. They can do none of that for the first. So the work goes to the second, and the first one stays where they are, and the market concludes there is no talent in Yemen, when what there is no supply of is verification.

The usual response is a marketplace: build a list, let people register, let clients browse, take a cut. Kayan does not do this and will not. A list transfers the risk to the client and calls it a platform. When the work is late, the client is alone with it. When the money does not arrive, the freelancer is alone with it. The intermediary carries nothing and so guarantees nothing, and in a market with no trust to begin with, an intermediary that guarantees nothing adds nothing.

Kayan takes the work, stands behind it, and builds the team that delivers it. That is a different business from a marketplace, and it can only be run on evidence. This system is where the evidence is made.

Standing behind the work has a precondition. Kayan cannot promise a client that a person is real, able and reliable unless Kayan has established those three things itself, to a standard it would defend to a partner, an auditor or a court. Verification is therefore not a feature of the platform. It is the thing being sold. Everything in this document exists to make that claim true and to make it repeatable at a volume that a small team of interns can actually sustain.

What the system must do

It must let anyone begin, including people whose documents were lost in a war. It must establish identity to a standard a bank would accept, and skill to a standard a client would accept, without either taking so long that people give up. It must place people into teams, pay them into their own accounts, record what they did in a way that follows them, and let them see all of it. It must recognise those who give their time back to the country without turning that into unpaid client work. And it must do all of this in a city with intermittent power, uneven connectivity and a workforce that has been let down by promises before.

02 How verification works

Verification is a permission system, not a badge. Each step grants a person the right to do something, and each is earned against evidence that a client would accept.

A single verified stamp is dishonest, because it collapses several different questions into one answer. Whether someone is who they say they are is a different question from whether they can do the work, which is different again from whether they have ever finished anything, whether they are reliable to deal with, and whether they actually have the hours they claim. A person may be plainly who they say they are and still be unreliable. A person may be excellent and have no record because nobody ever gave them one.

So Kayan keeps the questions separate. Five axes, each with its own evidence and its own owner. Identity gates the other four: nothing else is assessed while identity is unestablished, because assessing the skill of a person whose identity is unknown produces a fact about nobody.

Axis	The question	Evidence	Owner
Identity	Is this person who they say they are.	Government identity document; face match to profile photograph; liveness challenge; where no current document exists, a documented alternative attestation route.	POS-TAL-VER
Skill	Can this person do what they claim.	Portfolio artefacts with provenance notes; practical task assessment calibrated per specialisation; structured interview scored by two people against a published rubric.	POS-TAL-ASM
Track record	What has actually been delivered.	Acceptance rate; on-time rate; revision count per deliverable; rehire rate; dispute outcomes. Populated only from completed Kayan deliveries.	POS-MD-LEAD
Conduct	Is this person reliable to work with.	Response time to assignment offers; missed deadline rate; professionalism ratings from clients and pod leads; safeguarding record.	POS-TAL-LEAD
Capacity	Does this person actually have the time they claim.	Declared weekly availability; committed hours across live pods; double-booking detection; utilisation against declaration.	POS-MD-CO

The five axes combine into five tiers. The tier is what the platform reads when it decides whether a person may join a pod, lead one, review one, or speak to a client without supervision. The permission matrix is the contract between the ladder and the software: if a capability is not granted at a tier, the system must not allow it, regardless of who asks.

Tier	Name	What it means	What it grants
T0	Registered	The applicant exists in the registry and has accepted the rules. Nothing has been checked.	Visible to Kayan only. May apply to Forge cohorts. May volunteer. Cannot join a pod. Cannot receive paid work.

Tier	Name	What it means	What it grants
T1	Identified	Kayan knows who this person is and has seen evidence of what they can do.	Listed in the searchable talent pool. May join a pod as a contributing member. May receive supervised work. Card issued.
T2	Verified	An assessor has examined the work against a published rubric and a second human has spoken to the person.	Full portal access. May take the primary contributor role on a pod. Eligible for the published rate band. Featured in matching.
T3	Proven	The record, not the claim, now carries the person. Delivery history is the evidence.	May lead a pod. May serve as quality reviewer on pods they are not part of. Eligible for retainer engagements. Eligible to instruct at the Forge.
T4	Trusted	Kayan will put this person in front of a client, a partner or a government body without supervision.	May represent Kayan externally. Client-facing without supervision. May assemble pods. May conduct verification interviews. Advisory input on talent decisions.

THE GOVERNING RULE OF THE WHOLE SYSTEM

A machine may pass a person. Only a person may fail one. Automatic checks exist to clear the straightforward cases quickly, so that human attention goes where it is actually needed. No automatic check ever produces a rejection, a tier reduction, or a revocation on its own. Every negative outcome carries a named position, a written reason, and a route to appeal.

Moving up, and moving down

Eligibility is computed nightly from the ledgers. Crossing a threshold flags a person for review; it awards nothing. A named position then looks at the evidence and records a decision in writing. Promotion is never fully automatic, because the moment it is, the ladder becomes a game to be played rather than a record to be trusted.

Reduction is slower still. One bad cycle is life. Two consecutive cycles below the threshold opens a review, and the talent is told before anything changes, with the evidence, and with the appeal route in the notice itself. A person falls one step, not several, unless a specific sanction says otherwise. Dormancy costs a tier and is fully reversible: nobody is deleted from this registry for being quiet, because in this market being quiet usually means something happened, not that someone stopped caring.

The top of the ladder is deliberately hard to reach and does not stay reached. T4 carries the right to represent Kayan externally and to speak to a client unsupervised. It is awarded by a panel of three positions, minuted, and it lapses annually without renewal. A credential that cannot be lost is not a credential.

03 The applicant's journey

Eighteen screens, from a first click to a permanent place. The design problem is not collecting the data. It is holding the attention of someone who has filled in forms before and received nothing back.

Most registration funnels in this market fail in the same three places, and each failure has the same cause: silence. People abandon at the identity step because handing over a national identity document to an organisation that has explained nothing feels like a risk with no return. They abandon at the assessment because a timed task with a hidden rubric feels like a trap. And they abandon after submission, because nothing happens and nobody says anything, and after two weeks the reasonable conclusion is that nobody was ever going to.

Every design decision below is a response to one of those three. Orientation before data collection. The rubric published before the task. A status tracker that always names the next step, the owner and the expected date.

Orientation before anything is asked

Before a single personal field, six cards explain what Kayan is, how work arrives, how money moves, what verification is for, what is expected in return, and how long the whole thing will take. Each is acknowledged. Three short questions confirm the model landed, and a wrong answer shows the card again rather than blocking the person.

This costs two minutes and it is the highest-return two minutes in the funnel. People who understand that Kayan takes the work and stands behind it complete verification, because they can see what the effort buys. People who think they are joining a job board do not, because from that mental model the effort makes no sense.

CARD THREE, SHOWN BEFORE ANY PERSONAL DATA IS REQUESTED

The client pays before the work starts. The money is held, not spent. You are paid against accepted milestones, into your own bank account.

The identity step, designed for a conflict setting

A system that requires a current national identity document excludes precisely the people Kayan exists for. Displacement destroys documents. So the document types include a documented attestation route, and where it is used, the verification officer telephones the attesting authority personally and records the call. It is slower and it is entirely human, and it keeps a category of people inside the system who would otherwise be shut out at the door.

Everything checkable is checked in the browser, before upload. Twelve checks on the photograph and ten on the document. A person is told their photograph is blurry in the second it is taken, with the specific defect named and a guide one tap away. They are never told three days later. That single decision removes the largest single source of delay and of abandonment in the entire funnel.

The assessment, with the rubric shown first

The applicant sees the full scoring rubric before the task begins, chooses between two or three briefs within their specialisation, starts the timer themselves, and writes a short note explaining their approach. Work is saved

continuously, because a dropped connection must never destroy an hour of someone's effort. A late submission is accepted and flagged, never voided.

Assistance is declared, not policed. Using a machine to help is normal and is not penalised. Concealing it is a sanction. That distinction is deliberate: a rule that pretends the tools do not exist produces dishonesty, and dishonesty is the one thing this system cannot tolerate, because the entire proposition rests on the record being true.

Everyone receives the full scoring sheet and written feedback against every line, whether they passed or failed. A rejection that teaches nothing wastes the applicant's effort and Kayan's reputation in a city small enough that word travels. A rejection that names the gap, gives a retake date and points to a Forge cohort that covers it turns a failed applicant into a future one.

Screen	Name	Purpose
S00	Gateway	The first eight seconds. Explain the offer and remove the fear of a long form.
S01	Create account	Establish an account before any personal data is requested.
S02	Confirm channel	Prove the person controls the contact channel they gave.
S03	Orientation	Teach the model before asking for anything. Six cards, each acknowledged.
S04	About you	Collect the identity core that everything else attaches to.
S05	What you do	Map declared capability onto the taxonomy so matching can work.
S06	Your work	Gather evidence, not claims.
S07	Your time	Establish honest capacity before any assignment is possible.
S08	Getting paid	Set the payment route in the applicant's own name.
S09	Prove it is you	Identity verification: document, face match, liveness.
S10	The rules	Explicit, itemised, separately recorded consent.
S11	Show us	The practical assessment. The single most important screen.
S12	Talk to us	Book and hold the verification interview.
S13	People who know your work	Reference collection, requested by Kayan not the applicant.
S14	Where you stand	A live, honest status tracker. No silent queues.
S15	Your space	The permanent home. Where the relationship continues.
S16	Give back	The volunteer track, opened as a choice not a default.
S17	Your card	Digital credential, physical card request, verification link.

WHERE THE JOURNEY ENDS, AND DOES NOT

Registration is not the destination. The talent space is. A verified person logs in to see their standing on each axis and exactly what the next tier would require, live pods, accepted milestones, what is held and when it will be released, their full record, open calls, and the specific learning that would close the gaps their own assessment identified. A registry with no destination becomes a dead list within a quarter, and a dead list cannot be sold to anyone.

04 Pods, and how work reaches a person

Nobody bids for work at Kayan. Work arrives as an invitation to a team, and the team is assembled against a signed scope with the funds already secured.

A pod is a temporary team of two to seven verified people, formed for one engagement and dissolved after it. The floor of two is structural: a single person on a client project has no peer accountability, and peer accountability is cheaper and faster than supervision. The ceiling of seven is arithmetic: past that, coordination costs more than the additional capacity produces.

The assembly sequence begins only after scope is signed and funds are secured. No scope and no funds means no work, and that is a founding rule of the institution rather than a policy of this system. The registry is then queried against the pod specification, and the platform returns candidates ranked with a written reason for each: not a score, a sentence that a delivery lead can read and disagree with.

The matching engine never returns a single best option. It returns two or three configurations — one weighted to speed, one to cost, one to certainty — each with a risk note. **This is a fixed rule.** A single recommendation implies a guarantee the system cannot honestly make, and it removes the delivery lead's judgement from a decision that should carry it.

The pod lead chooses their own team from the shortlist and speaks to anyone they do not know, because the lead carries the quality and cannot carry it for a team assigned to them. A quality reviewer is appointed from outside the pod, at T3 or above, and is never a member of the pod being reviewed. Self-review is not review.

Role	Tier floor	Accountable for	Count
Pod Lead	T3 or above	Client interface, quality ownership, milestone integrity, dispute first response	One per pod. Mandatory above PH-POD-LEAD-THRESHOLD
Senior contributor	T3 or above	Substantive deliverables in their specialisation. Reviews junior work.	Zero or more
Contributor	T2	Standard deliverables against the specification	Zero or more
Supported contributor	T1	Supporting work under named supervision	Zero or more. Supervisor named in the pod brief
Quality reviewer	T3 or above, not a pod member	Runs the quality gate before client review	External to the pod. Independence is structural
Observer	T0	Learns by watching. No client visibility, no deliverable, no payment.	Zero or more, with the pod lead's agreement

Composition rules that are not negotiable, and one that is

Every paid member is at T1 or above. A single unverified person on a client project destroys the entire proposition, whatever the circumstances. Concurrency is capped, because a person on too many pods is a missed milestone waiting to happen. Every supported contributor has a named supervisor written into the pod brief, so that development is a commitment rather than an aspiration.

One rule is a target rather than an absolute: at least one woman on every pod. Where it is not achieved, the reason is recorded on the pod record and reviewed monthly. It is not quietly waived, and it is not enforced by putting a thumb on the matching scale — gender is never a matching input and is never shown to a client. The target is met by fixing the funnel, and the monthly review exists to find where the funnel is losing women, which is the only thing that actually moves the number.

05 Giving back, and what it earns

Kayan for Yemen is the civic arm. It runs across all three business lines and it is not a fourth one. Volunteering with Kayan is a civic act, and it is never client work performed for free.

That boundary is absolute and it is the reason the track can exist at all. A volunteer hour that ends up in a billed deliverable is not volunteering, it is unpaid labour with a better name, and an organisation that blurs the line once cannot credibly claim the line afterwards. So volunteer activity is matched only to civic activity, and the ledgers are separate.

The track is open at T0, before verification. That is a deliberate choice: someone who has not yet cleared identity checks can still give an afternoon to a community session, and requiring them to clear a bank-grade check first would defeat the purpose. Safeguarding orientation, on the other hand, is mandatory without exception and precedes any activity at all. There is no unsupervised contact of any kind before it is complete, and no circumstance in which that is set aside.

Hours are scanned in and out at the Hub or confirmed by the coordinator in the field. They are evidenced, never claimed. Validated hours and activities earn points, and points buy things that Kayan actually pays for — a day at the Hub, a meeting room, a contribution toward a Forge cohort, a place at an event, or a contribution made in someone else's name.

WHAT POINTS CAN NEVER DO

Points are not money and cannot be exchanged for it, transferred between people, or set against an invoice. No quantity of points moves a person up the Trust Ladder — evidence does that and nothing else does. Points cannot influence a shortlist, a pod invitation or a matching rank, and the matching engine cannot see them. A recognition system that can be converted into standing is a corruption of the standing.

At the hour threshold, a volunteer is offered the talent fast-track: their hours transfer into their profile as demonstrated experience and the skill verification fee is waived. It is an offer and not a conversion. Some people want to volunteer and do not want to be freelancers, and pressing them toward the paid track would tell them their contribution was only ever a recruitment device. Kayan accepts the answer either way.

06 The credential

The Kayan card carries the verification into the world, where a client can check it in five seconds without an application, an account, or a phone call.

The card is an institutional credential. It is not a payment instrument, it is not transferable, and it is not negotiable. It shows a name, a photograph, a tier band, a card number, a validity date and a verification code, and nothing else, because a public credential is not a public file.

Scanning the code opens a page showing the holder's name, photograph, card type, tier and validity, and a status banner that is green, amber or red. Never a document number, an address, a contact detail, an earnings figure or a project history. The person checking compares the photograph on the page to the person standing in front of them, which is what makes a photocopied card useless: the copy scans, and the page still shows whoever the card really belongs to.

Connectivity in Aden is not a given, so staff devices hold a short cache and fall back to visual verification beyond it. Every fallback check is logged and uploaded when the connection returns, because an unlogged check is indistinguishable from no check at all.

Card	Issued to	Validity	Revoked on
Talent card	T1 and above	PH-CARD-VALID-T	Tier change, revocation, expiry
Volunteer card	Registered volunteer with safeguarding orientation complete	PH-CARD-VALID-V	Lapse, safeguarding concern, conversion
Hub member card	Active Hub membership	Membership term	Membership end
Forge graduate card	Cohort completed with capstone accepted	PH-CARD-VALID-F	None. It records a fact.

Twelve card states, and every transition writes an immutable audit row with an actor, a timestamp and a reason. Nothing changes silently. That is what allows Kayan to answer, three years later, what a card's status was on a particular day and who changed it — a question that eventually gets asked, usually by someone with a legal interest in the answer.

07 Who runs this

This system is operated by interns, supervised by leads appointed at assistant grade. That is not a limitation to be worked around. It is the design input that shaped every procedure in it.

Kayan hires at assistant level and upgrades to Lead when a revenue trigger is met, and it operates as an internship-to-hire institution through January 2027. Every procedure in this system is therefore written to be executed by someone in their second week: numbered steps, one action per step, a named input, a named output, a control, and an instruction for what to do when it fails. Where a task genuinely cannot be executed by an intern — a screening hit, a safeguarding report, a T4 nomination — it is not given to one.

Three rules follow from this and they are not negotiable. Every function is cross-trained to two people, so no single position code is the only one able to clear a queue. Every accountability belongs to a position code and never to a person, so that a departure is an inconvenience rather than an outage. And every handover carries a written pack and an overlap week.

Capacity, not ambition, governs how fast the registry grows. Registration is throttled to what the verification queue can clear inside its published service level. **A queue that grows faster than it clears destroys trust faster than a closed door does**, because a closed door is honest and a silent queue is not.

The corollary is uncomfortable and is stated here so that it is not discovered later. A large registry is not an achievement. Fifty verified people who are all working is worth more than five hundred registered people who are not, and the second number is worth less than nothing, because every one of those five hundred was told something that turned out not to be true. The indicator that matters in this system is the share of the registry that has actually been placed, and it is on the dashboard for that reason.

Position	Accountability in this system	Grade
POS-TAL-LEAD — Talent and Verification Lead	Owns the Trust Ladder, the registry and every tier decision below T4.	Assistant level
POS-TAL-VER — Verification Officer	Runs identity, document and reference verification. Opens and closes cases.	Intern
POS-TAL-ASM — Assessment Officer	Administers and scores practical assessments against published rubrics.	Intern
POS-TAL-SUP — Talent Support Officer	First response on the talent channel; guides applicants through the funnel.	Intern
POS-MD-LEAD — Managed Delivery Lead	Owns client scope, pod specification and delivery acceptance.	Assistant level
POS-MD-CO — Delivery Coordinator	Runs the gate calendar, pod briefs and milestone tracking.	Intern

Position	Accountability in this system	Grade
POS-MD-QA — Quality Reviewer	Runs the quality gate before client review. Cannot review own pod.	Intern
POS-K4Y-CO — Kayan for Yemen Coordinator	Owens volunteer recruitment, safeguarding orientation and hour validation.	Intern

08 What is decided and what is not

Every structure, sequence, permission, obligation and control in this system is decided. Every amount, rate, threshold, service level and target is not, and appears as a marked placeholder.

This is a deliberate separation rather than an unfinished document. The logic of the system does not depend on the numbers: the identity axis gates the others whatever the pass mark is, and the queue has a service level whether that level is one day or four. But the numbers do depend on conditions that have not yet been measured — what the Aden market pays, what two interns can actually clear in a working day, what share of a calibration cohort passes a task that has never been sat.

Setting them now would mean inventing them, and an invented threshold has a way of becoming a real one that nobody can explain the origin of. Worse, several of these numbers become promises the moment they are published to applicants. A service level that was guessed is a promise that will be broken.

HOW THE PLACEHOLDERS RESOLVE

In one session, against real conditions, and then only once. The placeholder register lists every token, what it governs, and which position code resolves it. Four of them wait on evidence that does not yet exist: the two pass marks come from the first calibration cohort scored independently twice; the service levels come from timing the first fifty cases by hand; the rate bands come from the Hub and pricing rebuild against the Aden market.

Five questions cannot be resolved by evidence and require the chief executive. Each is recorded in the open forks register with the position this build has taken in the meantime, and each of those positions is reversible before the phase that would make it permanent. The build does not stall on any of them.

Fork	The decision	Position taken meanwhile
F-02	Whether the volunteer track opens at T0 or only after identity verification.	Open at T0. Exclusion at the door defeats the civic purpose. Reversible before phase P6.
F-03	Whether talent outside Yemen may hold T3 and T4.	No presence requirement above T2. The axes measure evidence, and evidence does not have a postcode.
F-04	Whether a Forge graduate enters at T1 automatically.	The capstone counts as evidence but does not replace the task. One standard, or it is not a standard.
F-05	Whether the public verification page shows the tier.	It shows the tier. A credential that says nothing verifies nothing. Reversible before phase P6.

09 Building it

Nine phases across nine months from August 2026. Automation is built last, on purpose.

The ordering rule is that nothing is automated until it has been run by hand often enough to be understood. Automation applied to a process that does not yet work reliably does not fix the process; it reproduces the fault at speed and makes it much harder to find. So verification runs manually against the written procedure for two months before the workflow engine touches it, and every one of those cases is timed, which is where the service levels come from.

The second rule is that no phase begins before its dependency is locked. The audit table exists before the first record it will describe. The purge job is proven in test before a single real identity document is accepted. The pass mark is set from calibration data rather than before it.

Phase	Scope	Done when
P0 — Foundation	Data model, authentication, account and channel verification, audit event spine, the taxonomy as reference data.	A person can create an account, prove their channel, and every action is already audited.
P1 — The front door	Gateway, orientation, profile, specialisation, evidence, capacity, payment route, consent. Full status tracker.	A person completes registration end to end and can see exactly where they stand.
P2 — Verification	Document capture with browser-side quality gates, live capture, liveness, face match, screening, the verification queue and the case workflow.	Identity verified end to end with a full audit trail and a purge job proven in test.
P3 — Assessment	Task bank, timed attempt with auto-save, submission, scoring interface, rubric lines, moderation, feedback release.	An assessment is taken, scored, moderated and returned with written feedback.
P4 — The talent space	Standing, invitations, live pods, earnings, record, open calls, learning, settings, data export.	A verified talent logs in and sees a live, useful home.
P5 — Pods and matching	Pod specification, shortlist with reasons and multiple configurations, invitations, memberships, performance ledger.	A pod is assembled from the registry and delivers against a real engagement.
P6 — Cards and civic	Card issuance, states, public verification page, volunteer track, hour ledger, points and redemption.	A card is issued, verified publicly, and a volunteer hour converts into points.
P7 — Automation and instrumentation	Every automation in the register, the notification matrix, queue dashboards, alert thresholds, the messaging integration.	Every queue is instrumented and every SLA breach raises an alert to a named position.
P8 — Hardening	Penetration test, load test, data protection review, disaster recovery drill, accessibility audit, bilingual review.	External test passed with findings closed. Recovery drill completed and timed.

The month plan states, for each month, what is built, what is run by hand in the meantime, what is decided, and the one thing that would mean the month failed. That last column matters more than the others. A month in which the

portal shipped and a real identity document was stored without a proven purge is a failed month, however much was built.

THE LINE THAT CANNOT BE CROSSED

This system holds identity documents belonging to people in a conflict setting. Political affiliation, ethnicity and tribal identity are never collected — not as optional fields, not for reporting, not at all — because a record that could expose someone to harm if it leaked should not exist. Document images sit in a separate encrypted store with their own key, visible to two position codes, with every view logged and reviewed monthly, and are purged on a schedule that is monitored by an alert. If the purge job does not run, someone is told the same day.

10 How to tell whether it is working

Twenty-five indicators, one dashboard, and one number that matters more than the rest.

The dashboard reads the registers directly, so it cannot drift from the records it describes. Population, funnel, activation, delivery, inclusion, health, credential and civic. Fifteen alerts, each naming a threshold, a position and a required action, because an alert with no named owner is noise that teaches people to ignore alerts.

Several indicators are deliberately two-sided. An identity pass rate that is very high may mean the check is not real. An assessment pass rate outside its band for two cycles means the rubric or the task is wrong, not that the applicants are. A registry that grows while placement does not is not growth, and there is an alert for it that pauses recruitment.

The single indicator that governs this system is the share of the registry that has ever been placed. **Everything else is an input to it.** A verified person who never works has been told something that was not true, and enough of those turn a talent map into a list of disappointed people who each know twenty others.

Family	Indicator	Read as
Population	Placeable talent, T1 and above	The only figure that may be quoted to a client.
Funnel	Identity pass rate	Very high may mean the check is not real.
Funnel	Median queue turnaround	Against the published service level, not against last month.
Quality	Assessment pass rate	Outside its band twice means the instrument is wrong, not the people.
Activation	Share of registry ever placed	The governing indicator of the whole system.
Delivery	First-pass quality gate rate	Whether verification is predicting anything real.
Inclusion	Women at T2 and above against the registry share	If it lags, the funnel is losing women. Find where.
Inclusion	Registry outside Aden	Reach beyond the city Kaya sits in.
Health	Dormancy	Reversible. Re-engagement runs before any reduction.
Integrity	Appeals upheld	A rate of zero means the appeal is not real.

Every target is a placeholder until the first quarter of real data exists. A target invented before the data is a guess with a decimal point on it, and the first thing it does is teach the team to hit a number that was never meaningful.
